

Hallway Systems

Your one-stop shop for doors
and hallway systems to
complete your storage facility.

Opt for the **Corrugated Hallway System**, which showcases 20" wide wall panels alongside matching filler panels designed to replicate the profile of your roll-up door, creating a textured and visually appealing hallway.

Or select the **Flush Hallway System**, characterized by 12" wide glossy white wall and header panels, delivering a sleek and seamless wall finish that maximizes light reflection.

Or mix it up and customize a hallway system somewhere in between.
Your facility, your choice.

Components of a Hallway System

A **Filler Panel** is typically chosen as an economical option as part of the corrugated hallway system to hide the working mechanism of the roll-up door. Available in the same color and profile as the roll-up door, the corrugated filler panel comes with all the necessary side and bottom channels for hassle-free installation.

When choosing a flush hallway system, a **Header Panel** hides the working mechanism of the roll-up door. The panel provides a smooth, contemporary look and is only available in glossy white. All angles and channels necessary for installation are included.

Single and Double Roll-Up Frames with backplates provide the jamb structure to mount the self-storage doors. A double roll-up frame supports two adjacent door guide channels; a single roll-up frame supports one. Double roll-up frames are available in sizes 12" to 24" wide; single roll-up frames are available in sizes 6" to 12" wide.

Both are manufactured to your project hallway heights from durable, prefinished, glossy white heavy-gauge steel. They work with Corrugated or Flush hallways and come with the necessary channels, angles, bases, and fasteners for a secure installation on exterior walls, floors, and /or ceilings.

Midspan Bracing is a galvalume heavy-gauge channel that affixes to the partition wall to enhance the integrity of the wall system and avoid the need for load-bearing walls.

Unit Wall Partition is a series of 20" wide galvalume panels that fit together to create the wall between storage units as an industry standard to expensive sheetrock. Hassle-free installation includes the component angles, channels, and fasteners for each floor's configuration.

Burglar Bars are galvanized or glossy white hat channels that attach horizontally to support columns and secure the space above the top of the hallway system or the unit partition.

Mesh and Mesh Angles effectively secure tenant contents while allowing ventilation and lighting inside each unit. The 2" x 2" 16 gauge mesh is installed across all units with mesh angle and clips.

Protection Package

Kickplates, made from diamond plate metal, are installed at the bottom of the hallway wall to help prevent potential damage caused by hallway traffic.

Miterer Corner Guards are 2" x 2' angles that provide additional protection for hallway corners to minimize damage caused by hallway traffic. They are available in a 45- or 90-degree angle profiles.
